

Prometheus AI Crypto Bot

One-Page Cheat Sheet

Connect in 5 steps

1. Open app, set a **PIN**.
2. Create an exchange **API key** (trading on).
3. Paste Key + Secret, pick exchange + **Spot**.
4. Click **Connect** with **Safe Mode** ON.
5. Verify, then Safe Mode off + **small size**.

API key - get this right

- Enable **Reading** + **Spot** (or Futures).
- **Withdrawals OFF** - always.
- **Whitelist your IP**: app's **Show my IP** -> Copy -> paste on exchange.
- **Passphrase** needed: OKX, KuCoin, Bitget.
- **USA**: use **Binance.US** (not binance.com).

Cloud signals (licence)

- Webhook tab -> paste **Relay URL** + **Licence token**.
- Set **Strategy filter** = **Prometheus**.
- No TradingView / ngrok needed.

Key settings

- **Trade Size** is in coins (0.006 BTC ~ \$420), not \$.
- **Sizing**: Fixed lot or Risk % of balance.
- **Auto TP1/TP2** scale-out on signals.
- **Guardrails**: daily loss/profit halt, max positions, cooldown, dedupe.
- **PANIC: Close All** flattens everything.
- **Alerts**: Sound / Desktop / Telegram + daily P&L.

Fees rule of thumb

- ~**0.1% per fill** (~0.2% round trip).
- Keep **TP > 0.25%** to beat fees.
- Fewer, better trades > many small ones.

Quick fixes

- **Insufficient balance** -> lower Trade Size.
- **-2015 / invalid key** -> enable trading + whitelist IP.
- **451 restricted** -> Binance.US / other / no VPN.
- **\$0 balance** -> funds in wrong wallet (Spot vs Futures).
- **no market symbol** -> use BTCUSDT (not BTCUSD).

Safety: withdrawals off - IP whitelisted - test in Safe Mode - trade small. Real money when Safe Mode is off.
