

# Prometheus AI Crypto Bot

## One-Page Cheat Sheet

### Connect in 5 steps

1. Open app, set a **PIN**.
2. Create an exchange **API key** (trading on).
3. Paste Key + Secret, pick exchange + **Spot**.
4. Click **Connect** with **Safe Mode** ON.
5. Verify, then Safe Mode off + **small size**.

### API key - get this right

- Enable **Reading** + **Spot** (or Futures).
- **Withdrawals OFF** - always.
- **Whitelist your IP**: app's **Show my IP** -> Copy -> paste on exchange.
- **Passphrase** needed: OKX, KuCoin, Bitget.
- **USA**: use **Binance.US** (not binance.com).

### Cloud signals (licence)

- Webhook tab -> paste **Relay URL** + **Licence token**.
- Set **Strategy filter** = **Prometheus**.
- No TradingView / ngrok needed.

### Key settings

- **Trade Size** in coin or **USDT (\$)**; Sizing: Fixed / Fixed \$ / Risk %.
- **Auto TP1/TP2** scale-out on signals.
- **Guardrails**: daily loss/profit halt, max positions, cooldown, dedupe, **loss-streak pause**, **drawdown halt**, **trading hours**.
- **Slippage guard** + round-up-to-min; >10x futures warns.
- **Close %** banks part of a winner; **PANIC: Close All** flattens.
- **Alerts**: Sound / Desktop / Telegram + daily P&L.

### Test & 24/7

- **Test Signal** (Webhook): fake BUY through the real pipeline (sim in Safe Mode).
- **Run on Windows startup** + **Minimize to tray** = unattended 24/7.

### Fees rule of thumb

- ~**0.1% per fill** (~0.2% round trip).
- Keep **TP > 0.25%** to beat fees.
- Fewer, better trades > many small ones.

### Quick fixes

- **Insufficient balance** -> lower Trade Size.
- **-2015 / invalid key** -> enable trading + whitelist IP.
- **451 restricted** -> Binance.US / other / no VPN.
- **\$0 balance** -> funds in wrong wallet (Spot vs Futures).
- **no market symbol** -> use BTCUSDT (not BTCUSD).

**Safety**: withdrawals off - IP whitelisted - test in Safe Mode - trade small. Real money when Safe Mode is off.
