

Prometheus AI Crypto Bot

Quick Start Guide for Customers

Auto-trade crypto - built-in strategy or your signals. Secure, simple, yours.

The Prometheus AI Crypto Bot runs on your Windows PC and trades crypto automatically - from its built-in EMA + RSI strategy, from your TradingView signals, or manually. It includes one-click strategy presets, a backtester, a live chart, risk guardrails, analytics, Telegram alerts, and PIN-encrypted storage for your API keys. Works with **Binance, Binance.US, Bybit, OKX, KuCoin, Bitget, Kraken and Coinbase**.

Get started in 5 steps

1. Open the app and create a **PIN** (it encrypts your saved keys).
2. Create an exchange **API key** with trading enabled (see page 2).
3. Paste your **API Key + Secret**, pick your exchange and **Spot/Futures**, then click **Connect** - keep **Safe Mode** on for your first run.
4. Activate your licence: click **Start Free Trial** (enter your email) or paste a **Licence token** under the **Connect & License** tab.
5. Pick a strategy preset (**Balanced**), watch it in Safe Mode, then turn Safe Mode off and trade a **small size**.

The setup strip under the top bar lights up as you go: (1) Connect -> (2) Activate license -> (3) Start trading.

What the screen shows

- **Top bar:** connection status, a mode badge (LIVE / TESTNET / SAFE / READ-ONLY), exchange, balance, live P&L, and the gear for Settings.
- **Status strip:** the setup checklist plus live chips - Strategy / Webhook / Cloud / Paused.
- **Left:** API Settings, your public IP (for whitelisting), the Chart / Backtest / Analytics buttons, Open Positions, and BUY / SELL (with a live order preview).
- **Right:** Trade Settings (5 tabs) and the live Trade Log.

1. Create your exchange API key

On your exchange go to **API Management -> Create API**, then set the permissions below. This is the most important step - most connection problems come from a missing permission or IP whitelist.

Enable Reading	Yes	Yes	Balance & positions
Spot & Margin Trading	Yes	-	Place spot orders
Futures / Derivatives	-	Yes	Place futures orders
IP whitelist	Yes	Yes	Required once trading is on

- **IP whitelist:** click **Show my IP -> Copy** and paste it into your exchange's trusted-IPs box. The app warns you if your IP changes.
- **Passphrase:** OKX, KuCoin and Bitget give a third secret - paste it into the app's Passphrase field. Binance and Bybit do not use one.
- **United States:** binance.com is blocked - choose **Binance.US** (or Bybit / OKX / KuCoin / Bitget / Kraken / Coinbase).

2. Connect (start in Safe Mode)

1. Select your **Exchange** and **Market** (Spot is the safer default).

2. Paste **API Key**, **Secret** (and **Passphrase** if shown).
3. Leave **Safe Mode** ON for the first run - real prices & balance, but fills are simulated, so you can verify everything risk-free.
4. Click **Connect**. The status light turns green, the mode badge shows your mode, and your balance appears.
5. Happy? Turn Safe Mode off (you'll confirm once) and trade small. (Prefer a paper exchange? Tick **Use exchange testnet** and connect with testnet keys.)

3. The settings tabs

- **Execution:** Trade Size (coin or USDT \$), Sizing mode (Fixed lot / Fixed \$ / Risk %), Auto-place SL/TP with TP1/TP2 scale-out, order type, a **Slippage guard**, round-up-to-minimum, and (futures) leverage & margin with a high-leverage warning. Hover any field for a tooltip.
- **Modes & Risk** (scrollable): Manual trading, Safe Mode, testnet, Pause new entries, Read-only, and the full **Guardrails** set - grouped into Position limits, Daily limits, Timing and Risk halts - plus trailing stop, move-to-breakeven, Run on startup and Minimize to tray.
- **Strategy:** the built-in EMA + RSI strategy with one-click presets and an Advanced section (page 3).
- **Connect & License:** the TradingView webhook + Strategy filter (acts only on your indicator), a Test Signal button, your Licence token, and Start Free Trial / Get License.
- **Alerts:** Sound, Desktop and Telegram notifications (with Test buttons), an important-events-only filter, and an end-of-day P&L summary.

Saving: most fields apply live; click **Save** to keep them across restarts. An "unsaved changes" marker appears when something hasn't been saved yet.

4. The built-in strategy & presets

- On the **Strategy** tab the bot runs its own port of the indicator - an EMA20 + RSI-50 crossover that trades both **long and short** - directly on exchange candles. No TradingView account needed.
- **Presets - one click:** **Conservative** (fewer, stricter trades), **Balanced** (recommended), **Aggressive** (more trades, trails the runner). The active preset is highlighted; hand-edit any field and it switches to Custom.
- **Advanced** (optional): confirmation candles, body filter, Trend EMA filter, ATR stop, TP1/TP2 targets, Trailing x ATR, and an ADX trend-strength filter.
- **Symbols & timeframe:** trade one or a comma-separated list of pairs on your chosen timeframe.
- The strategy only trades when **enabled + connected + licensed** - and it respects every guardrail and your sizing settings, exactly like signal trades.

5. Chart, Backtest & Analytics

Three buttons on the main window open the analysis tools. They follow your live Strategy settings and pair list.

- **Chart:** candlesticks with EMAs, RSI, volume and every BUY / SELL / scale-out / exit marker, a live last-price line, plus entry, stop and TP lines.
- **Backtest:** replay the strategy on real history. Spot is long-only; **Futures runs long + short** (matching what you can actually trade). Includes an optimizer (parameter sweeps), a walk-forward test to guard against curve-fitting, a buy-&-hold benchmark, an equity curve, and CSV export.
- **Analytics:** win rate, profit factor, per-symbol stats and an equity curve, with a date-range filter, Clear and Export CSV.

6. Trading & open positions

- **Manual:** pick a Symbol, set the size, press **BUY** or **SELL**. The preview above the buttons shows what will be sent.

- **Automatic:** signals from the built-in strategy, your webhook or the cloud feed open the trade plus its TP1/TP2 brackets for you.
- **Open Positions:** Close Selected, **Close %** (bank part of a winner - 25/33/50/75%), Set SL/TP, or **PANIC: Close All** to flatten everything instantly.

7. Settings (the gear)

The gear in the top-right opens app preferences - the things you set once.

- **Security:** Change PIN, and **Lock now** (hide the app behind your PIN without quitting). **Forgot your PIN?** Ask support to authorise a reset, then click **Forgot PIN?** on the unlock screen, enter your email and set a new PIN - your licence is kept (you'll re-enter your exchange keys). Only one copy of the app runs at a time, so you can't accidentally double-trade.
- **Appearance:** Text size - Small / Normal / Large - for readability on any screen.
- **Data & backup:** Backup / Restore settings, Open data folder, View log file (handy for support), and Clear history / log.
- **Startup & updates:** run on Windows startup, minimize to tray, start minimized, auto-connect on launch, and check for updates.

8. Fees & sizing - read this

- Spot fees are about **0.1% per fill (~0.2% round trip)**. Keep take-profits above ~0.25% so wins clear the fee.
- **More trades is not more profit** - frequent trading bleeds capital in fees. Quality over quantity.
- **Risk-based sizing** (recommended) sizes each trade from your Risk % and the stop distance, so position size scales with your balance.
- On Binance, holding **BNB** lowers fees by ~25%.

Troubleshooting

Insufficient balance	Your lot costs more than your balance (size is in coins, not \$). Lower the Trade Size, or use Risk % sizing.
Invalid API-key / -2015	Trading not enabled or IP not whitelisted. Enable Spot/Futures and add your IP (Show my IP).
Futures rejected (-2015)	Your key/account isn't enabled for Futures, or the IP isn't whitelisted for it. Enable Futures trading on the key and whitelist your IP.
Restricted location / 451	Exchange blocked in your region. US: use Binance.US. Else: another exchange or turn off VPN.
Balance shows \$0	Funds are in the other wallet. Move USDT to Spot (Market=Spot) or Futures (Market=Futures).
does not have market symbol	Pair mismatch - pick the pair from the dropdown (the app lists your exchange's pairs).
Telegram not arriving	Open Alerts, click Test. Message your bot once, check the token & chat id. The app falls back automatically behind strict firewalls.

Running 24/7

- **Run automatically when Windows starts + Minimize to tray** (Modes & Risk, or the gear): the bot keeps trading in the background. Combine with Safe Mode off and a saved licence so it runs unattended.
- Leave the PC on (or use a small always-on PC / VPS) and keep your exchange IP whitelist updated.

Security checklist

- Your IP added to the key's whitelist.
- Tested in **Safe Mode** before going live.
- Trading a **small size** until you trust it.
- Keys live only in the app - encrypted behind your PIN.

Need help? Email support@prometheusai.tech or visit prometheusai.tech. Trading places real orders with real money when Safe Mode is off - start small and never risk funds you can't afford to lose.
